StitchSafe: Pitch Script

Agree it, hold it, check it, release it.

Title

StitchSafe: an AI payment agent that protects home and boutique tailors and their customers.

The problem

Custom tailoring runs on chat messages and trust. The customer pays a big advance and waits weeks. The tailor buys and cuts fabric before knowing whether the customer will accept the result.

The issue

- The customer fears a wrong color, neckline or sleeve, or no outfit at all, with the advance already gone.
- The tailor fears the customer refusing to pay after the fabric is cut, and a made-to-measure outfit cannot be resold.
- There is no evidence of what was agreed, only old chats.
- Prices change mid-job with no record.
- Overseas customers have no buyer protection, and new customers have no reason to trust an unknown tailor.

The solution

StitchSafe turns a chat order into a written agreement, then protects both sides:

1. **Agree:** AI turns the order into a checklist that both sides accept.
2. **Hold:** the customer's payment is held through PayPal, not sent.
3. **Check:** AI compares photos of the finished outfit with the checklist.
4. **Release or return:** the tailor is paid when the outfit matches and the customer confirms the fit, or the money goes back if the order is cancelled.

How new customers learn to trust the tailor

- Money is held, not sent, and every page says so.
- The tailor's page shows verified phone and PayPal badges, portfolio photos, and reviews only from completed paid orders.
- Refund and cancellation terms are shown before paying.
- First-time customers get a discount the tailor chose, shown upfront.
- A Report a problem button keeps the money on hold.

Sign-in

Customers and tailors sign in with PayPal, verify a phone number with a one-time code, and fill a short profile. Login only proves identity. Every payment is still approved in PayPal checkout.

When the price changes

If a $200 order becomes $500 because the customer wants embroidery, the original price stays locked. The tailor quotes only the add-on, and AI records it as a new version. The new total takes effect only when both sides accept and the customer funds it. The customer can accept, counter or decline, with at most 3 counter-offers.

Discounts, shipping and other charges

The first-order discount, shipping, rush fee and customs duty are all shown in the checklist before payment. The server calculates the total, and AI never sets a price.

Role of PayPal

- Authorize holds the funds when the customer approves.
- Capture releases them after the check passes and the customer confirms the fit.
- Void returns them if the order fails or is cancelled.
- Log in with PayPal handles sign-in.
- A payment link or UPI cannot hold money and release it later, and overseas customers get a payment method they already trust.

Role of AI

- Turns chat into a checklist.
- Records add-ons and flags big price jumps.
- Checks outfit photos against each item.
- Writes polite, specific feedback for the tailor.
- Writes the receipt that explains why money was released or returned.

AI recommends and explains. Server rules control every payment.

Honest limit

Photos show color, style and visible details, but not how an outfit fits a body, so the customer makes the final fit confirmation.

What to build

Build in three tiers so you always have a working demo, and add the next tier only when the one before it works end to end.

Tier	What	Done when
1. Must build	Sign-in and phone page, chat to checklist, tailor accepts, PayPal authorize, photo upload with AI verdict, capture on pass and customer confirmation, void on cancel, receipt timeline	One full order runs from chat to released payment in the sandbox
2. Winning features	Chat import, reference-photo checklist, price-lock add-ons, trust page	Each works in the demo video
3. Stretch	Voice orders, milestone payments, payout to the tailor	Mention in the pitch as future work only

Unique and winning features

Most entries will be a checkout button with a chatbot. These features make StitchSafe a specific tool for a real trade, and each one shows AI and PayPal doing real work.

Feature	What it does	Why it stands out
Chat import	The customer or tailor pastes a WhatsApp or Instagram order chat, and AI extracts the checklist, price and deadline	Meets tailors where they already work, and it is a 10-second demo moment
Reference-photo checklist	The customer uploads a photo of the design they want, and AI turns it into checklist items (neckline, sleeve, embroidery, color)	Replaces vague descriptions with checkable items
Photo verdict with evidence	AI marks every item met, partly met or not met, and points to what it saw	Objective proof instead of an argument
Price-lock add-ons	Add-ons become new versions with a clear difference, while the original price stays locked	Solves the $200 to $500 problem fairly
Hold-and-release by rule	PayPal authorize, capture and void tied to the AI verdict and fit confirmation	Real escrow that payment links and UPI cannot do
Verified trust page	Phone and PayPal badges, portfolio, and reviews only from released orders	Answers why a stranger should be trusted
Multilingual orders	Chat in Tamil, Hindi or English, with the checklist shown in two languages	Fits Indian tailors and overseas family, and shows off the AI
Dispute evidence pack	One click builds a timeline of versions, photos and messages for a human to review	Turns disputes into a short review instead of a fight

Pick for the 5-day build: chat import, reference-photo checklist, photo verdict and price-lock add-ons. Treat the trust page as light: badges and a portfolio, with reviews only if time remains. Do multilingual by asking Claude to return the checklist in both languages, which costs almost no extra code.

New feature ideas for later

- Measurement check: the tailor photographs the garment with a measuring tape, and AI reads the visible number. Treat this as experimental and keep the customer's confirmation as the final word.
- Milestone payments, for example 30 percent at cutting and 70 percent at approval.
- Late-delivery discount that applies automatically.
- Returning-customer and referral discounts.
- Voice orders and a WhatsApp bot.
- Payout to the tailor through the PayPal Payouts API.

Tech stack details

Layer	Choice	Details
Frontend	Next.js (App Router), TypeScript, Tailwind CSS	Pages: sign-in, phone verification, profile, tailor shop page, order chat, checklist review, photo upload, receipt timeline
Backend	Next.js API routes	Routes for orders, checklist versions, PayPal calls, AI calls, uploads
Auth	Auth.js with a custom OpenID provider for Log in with PayPal	Fallback is an email magic link if PayPal login takes more than a day

Layer	Choice	Details
Phone OTP	Firebase Authentication phone sign-in or Twilio Verify	Use test numbers with fixed codes for the demo and say so in the README
AI	Claude API with the official SDK, a current Claude model, text and image input	Return JSON only, validate with Zod, retry once, then fall back to manual review
Payments	PayPal REST Orders API v2 plus the PayPal JS SDK buttons, sandbox	Create order with intent AUTHORIZE, authorize, capture, void; store authorization IDs
Database	PostgreSQL on Supabase or Neon for the hosted demo, SQLite locally, through Prisma	A free Render instance can reset its disk, so do not keep demo data in a local SQLite file when hosted
File storage	Supabase Storage or Cloudinary free tier	Portfolio, reference photos, outfit photos, with size and type limits
Hosting	Render free tier	Gives the hosted demo URL; set all keys as environment variables
Tooling	Git, GitHub public repo with MIT license, a .env.example file	Keep secrets out of the repo

Main AI calls

- Checklist builder: chat text or pasted chat, plus an optional reference photo, returns items and price lines.
- Change writer: current checklist plus the request returns Version 2 and a difference summary.
- Photo checker: checklist plus outfit photos returns a verdict per item, with evidence and feedback.
- Receipt and evidence writer: order events return a plain-language summary.

Main PayPal calls: get token, create order (AUTHORIZE), authorize, capture, void. Confirm current limits for the authorization honor period and total validity in the PayPal docs, and keep demo orders short.

Closing line

StitchSafe lets a customer order a custom outfit from anywhere. The deal is written down, PayPal holds the money, AI checks the work, and the tailor is paid when the outfit matches.

Spoken version (about 90 seconds)

Ordering a custom outfit from a home tailor or boutique means paying a big advance and hoping for the best. If the color is wrong, you have no proof. If the price jumps halfway, you have no record. And the tailor fears the opposite: cutting expensive fabric for a customer who might refuse to pay.

StitchSafe fixes this. You sign in with PayPal, verify your phone, and describe the outfit. AI turns it into a checklist that the tailor accepts. First-time customers get a discount the tailor chose, shown upfront. You pay through PayPal, and the money is held, not sent.

If you later want embroidery, the tailor quotes the add-on, AI records it as a new version, and the new price takes effect only when both of you agree. The original price stays locked.

When the outfit is ready, the tailor uploads photos, and AI checks them against every item. If they match and you confirm the fit, PayPal releases the payment. If not, the tailor gets exact fixes. If the order is cancelled, your money goes back.

PayPal's authorize and capture makes the hold possible. AI makes the check fast and fair. The customer is protected, and the tailor is paid when the work is right.
